

Crop Duster

Project: Underside of Crop Dusting Plane

Category: Abrasion

System: Rhino Linings TUFF STUFF

Job Description

When these crop dusting planes are in action, they dispense pesticides and herbicides in the form of pellets. These pellets, when dropped from a moving plane, act like sand blasting particles, and they strip the paint and begin to damage the underside of the fuselage which is extremely expensive to repair.

TUFF STUFF was sprayed to the underside of the fuselage, successfully protecting the plane from damage. An ever increasing number of crop dusting planes are being sprayed with very positive results.
