

## Forklift Tyne protection

**Project:** Industrial Vehicle Applications

**Category:** Abrasion and Impact Protection

**Completion**

**Date:** February 2011

**Product:** Rhino Duraspray

**Dealer:** Rhino Linings Westside, Sydney NSW

## Job Description:

This forklift is used mainly for loading large stainless steel pipes. The owner and their customer were concerned that the new pipes were getting scratched up the tynes. Rhino Linings Westside originally applied Rhino Duraspray to the forklift tynes over two years ago as a trial. The forklift is rented out for heavy industrial use between jobs and damage was a concern. The tynes were recoated as they had finally succumbed to two years of rental abuse.

The process included surface profiling and priming, then masking the sides with tape and pouring in the polyurethane to a thickness of 10mm. The edges were ground down to a smooth finish to reduce impact damage in use.

The customer once again is very pleased with the outcome and will continue to maintain their forklift tynes using Rhino Linings Duraspray for continual abrasion and impact protection.
